CONFIDENTIAL BUSINESS PROPOSAL

AI Intelligence Module

A secure, source-grounded AI assistant for the Client's business management system

Proposal detail	Value
Prepared for	Client Management Team
Prepared by	AGI Innovations Private Limited
Proposal date	25 September 2026
Estimated delivery	3-5 weeks from approved data readiness
Implementation fee	USD 2,500 / PKR equivalent at invoice date

Give authorised users faster access to approved business knowledge and permitted operational information - without compromising branch, role or data boundaries.

This proposal is valid for 15 days from the proposal date.

1. Executive Summary

AGI Innovations proposes a controlled AI Intelligence Module integrated into the Client's existing business management system. The assistant will retrieve answers from approved documents and permitted business records, allowing staff to search, understand and summarise information in natural language while preserving user and branch permissions.

What this solves

- Staff spend less time searching policies, product information, procedures and operational records.
- Approved users receive concise, source-referenced answers in the context of the systems they already use.
- Branch and role controls remain in force: users can retrieve only information they are permitted to view.
- Management can improve knowledge consistency while retaining human review for business decisions.

Important clarification

This is not a new large language model trained from scratch. It is a retrieval-augmented generation (RAG) solution: the AI retrieves relevant approved sources at answer time and uses them to produce a grounded response with references.

Value posture

The expected productivity and knowledge-access benefits are directional objectives. Actual time savings, adoption and business impact will be measured after launch using agreed user questions and usage feedback.

2. Included Scope

Workstream	Included deliverables
AI assistant experience	A natural-language chat experience integrated into the Client's business management system.
Knowledge ingestion	Ingestion and indexing of approved documents, SOPs, policies, product information and agreed business records.
Permission-aware retrieval	Role and branch filters applied before retrieval so users access only permitted content.
Grounded answers	Source references with responses and a safe fallback when approved sources do not support an answer.
Operational insights	Read-only search, summaries and permitted operational questions for the initial release.
Quality & handover	Agreed test-question set, evaluation, administrator guidance, user orientation and controlled launch.

Priority initial use cases

- Ask questions across approved SOPs, policies, product information and internal knowledge.
- Summarise relevant permitted records, notes and operational information.
- Guide users toward the relevant process, record or source document.
- Provide management-approved knowledge answers consistently across authorised teams.

3. Data Security & AI Guardrails

The AI module is designed as an assistive capability, not an autonomous decision-maker. It will operate within agreed data, access and review controls.

Control	How it protects the Client
Approved source boundary	Only sources approved by the Client's nominated data owner are indexed for AI use.
Role and branch controls	Retrieval respects application permissions, including branch-level data separation where configured.
Source references	Users can see the source material supporting an answer and verify it before acting.
Safe fallback	The assistant can state that it cannot find support in approved material rather than inventing an answer.
Read-only initial release	The assistant will not create, change, approve or post business transactions in the initial scope.
Human accountability	Users and designated approvers remain responsible for commercial, financial and operational decisions.

Data readiness

The Client will nominate a data owner, provide approved and reasonably organised source material, and confirm the user/branch permission model. Extensive data cleansing, broad historical migration, complex multilingual corpus preparation and private/on-premise model infrastructure are outside this fixed scope unless separately agreed.

4. Delivery Plan

The module can be delivered in approximately three to five weeks after the Client confirms data readiness and assigns the required owners.

Stage	Timing	Outcome
Discovery & design	Week 1	Confirm sources, user groups, data boundaries, test questions, guardrails and acceptance criteria.
Build & integration	Weeks 2-3	Set up knowledge ingestion, retrieval, application integration, permission filtering and answer citations.
Evaluation & refinement	Week 4	Test against agreed real business questions, resolve material issues and finalise administrator guidance.
Controlled launch	Week 5 if required	Train users, release to approved groups, monitor early use and hand over operating guidance.

Client responsibilities

- Nominate one project owner and one AI data owner.
- Provide approved source documents, user groups and access decisions on the agreed timetable.
- Supply and validate a practical set of real business questions for testing.
- Make authorised users available for acceptance testing and launch orientation.

5. Commercial Proposal

Commercial item	Value
AI Intelligence Module - one-time implementation	USD 2,500 / PKR equivalent at invoice date
Implementation period	3-5 weeks from approved data readiness
Included post-launch support	30 calendar days of remote warranty support for delivered-scope defects
Taxes	Applicable taxes, if any, are excluded and charged as required by law

Payment schedule

Milestone	Share	Amount
Kickoff and AI discovery approval	50%	USD 1,250
UAT-ready solution	30%	USD 750
Controlled launch and handover	20%	USD 500

Recurring services

Model/API usage, cloud hosting, vector database, domain and third-party service charges are excluded from the one-time implementation fee and will be charged separately based on the selected service providers and actual usage.

Items requiring separate scope

- Autonomous write-actions, approvals or transaction creation.
- Private/on-premise model hosting, advanced integrations and custom mobile AI applications.
- Extensive source-document cleansing, custom analytics, OCR and multilingual model training.
- Ongoing managed support, monitoring or enhancements after the included warranty period.

6. Acceptance & Next Decision

The implementation is accepted when the AI assistant demonstrates the agreed core use cases, observes the agreed permission controls, returns source-referenced responses where relevant, and completes the jointly approved evaluation questions. Material defects that prevent the agreed workflows will be corrected before controlled launch.

Recommended next decision

Approve the AI Intelligence Module, nominate the project and data owners, and schedule the Week 1 discovery session to confirm sources, access controls and the evaluation question set.
