CONFIDENTIAL BUSINESS PROPOSAL

Integrated ERP & AI Business Management System

A secure multi-branch ERP platform with a grounded AI Intelligence Module

Proposal detail	Value
Prepared for	Client Management Team
Prepared by	AGI Innovations Private Limited
Proposal date	25 September 2026
Phase 1 delivery	8 weeks from project kickoff
Phase 2 delivery	3-5 weeks after approved data readiness
Status	For discussion and scope confirmation

A phased operating platform that enables independent branch operations, central visibility and safe access to the organisation's approved knowledge through AI.

Commercial terms and scope boundaries are detailed in this document. This proposal is valid for 15 days.

1. What the Client Is Building

The Client requires one cloud-based business management system for multiple branches. Islamabad, Lahore and Karachi will operate within their own data boundaries, while approved management users can see consolidated information. A second phase will add an AI assistant that retrieves answers from approved company material and permitted ERP data.

Business outcomes

- Single source of truth for sales, stock, service, procurement and finance operations.
- Branch-level data separation, permissions and reporting; no accidental cross-branch data exposure.
- Consolidated management dashboards for authorised leadership users.
- Faster access to policies, records and operational insights through a source-grounded AI assistant.
- A scalable foundation for adding future branches and controlled new capabilities.

Priority use cases

Use case	Operational effect	Value hypothesis
Branch operations	Teams work only within their assigned branch records.	Risk reduction and cleaner accountability.
Management reporting	Authorised users compare branch performance in one workspace.	Faster oversight and decision-making.
AI knowledge access	Staff retrieve approved answers with source references.	Higher productivity and reduced information search time.

Value posture: the operational benefits above are design objectives, not guaranteed savings. Baseline user volumes, search time and transaction data must be confirmed during discovery before a quantified ROI claim is made.

2. Phase 1 - Multi-Branch ERP Implementation

Phase 1 converts the current functional ERP experience into a production-ready platform for the initial three branches: Islamabad, Lahore and Karachi.

Area	Included Phase 1 deliverables
Secure platform	Central database, production deployment, authentication, user roles, branch assignment, audit-ready activity logging and backup approach.
Commercial operations	CRM, opportunities, quotations, orders, deliveries, invoices, receipts and receivables.
Inventory & procurement	Products, warehouses, branch transfers, batches/serials, suppliers, requests, orders and goods receipts.
Service & oversight	Equipment, service tickets, maintenance, contracts, reports, approvals and consolidated dashboards.
Implementation	Discovery workshops, data templates, agreed initial migration assistance, UAT, training, go-live and handover.

Access principle

- A user is assigned a role and one or more permitted branches.
- Branch users see their assigned records by default; cross-branch access requires explicit authorisation.
- Management visibility is consolidated without giving every user unrestricted access.
- New branches follow the same governed model and are separately configured after Phase 1.

3. Phase 2 - AI Intelligence Module

Phase 2 adds a controlled AI assistant inside the ERP. It is not a new model trained from scratch. It uses retrieval-augmented generation (RAG): the assistant retrieves relevant information from approved sources at answer time and responds with references to those sources.

Included capability

- Chat interface integrated into the ERP workspace.
- Ingestion of approved documents, SOPs, policies and selected ERP records.
- Role- and branch-aware retrieval: a user can retrieve only information they are permitted to access.
- Source references with each answer, plus a safe fallback when the answer is not found in approved material.
- Read-only insights for the first release: search, summaries and operational questions. The assistant will not create, edit or approve business transactions without separately approved workflow controls.
- Quality testing against a jointly agreed set of business questions, plus administrator handover.

AI guardrails

Control	How it protects the Client
Data boundary	Branch and role filters are applied before retrieval; sensitive records remain permission controlled.
Grounded answers	Responses use approved sources and show references; the system can decline when support is missing.
Human accountability	Users remain responsible for decisions; AI output is assistance, not an autonomous approval or financial authority.
Auditability	AI queries and operational events can be logged subject to the agreed retention policy.

Data readiness dependency: delivery assumes the Client supplies approved, organised documents and identifies data owners. Extensive legacy-data cleansing, multilingual corpus preparation and self-hosted/private model infrastructure are not included unless separately scoped.

4. Delivery & Governance

Phase	Timing	Decision-useful outcome
ERP discovery & blueprint	Week 1	Confirm branches, roles, workflows, data, reports and acceptance criteria.
ERP build, testing & go-live	Weeks 2-8	Production-ready initial branches, UAT, training and launch support.
AI discovery & data readiness	Week 1 of Phase 2	Approve sources, permissions, test questions, guardrails and success criteria.
AI build, evaluation & launch	Weeks 2-5 of Phase 2	Grounded assistant, access controls, evaluation, training and controlled release.

Client responsibilities

- Nominate a project owner, branch key users and an AI data owner.
- Provide timely process decisions, clean agreed data/templates and approved source documents.
- Review demonstrations, complete user acceptance testing and approve milestone acceptance within five business days.
- Confirm the permissions matrix and business questions used to evaluate AI answers.

Change control

Any scope outside this proposal will be documented with impact on delivery dates and cost before work begins. This protects the Phase 1 and Phase 2 timelines and avoids uncontrolled changes during implementation.

5. Commercial Proposal

The engagement is intentionally phased so the ERP foundation and its branch controls are established before AI is given access to approved business information.

Investment	Fee	Included
Phase 1: Multi-Branch ERP	PKR 1,200,000	Initial Islamabad, Lahore and Karachi rollout; implementation scope in Section 2.
Phase 2: AI Intelligence Module	USD 2,500 / PKR equivalent at invoice date	Controlled RAG assistant, ERP integration, branch/role-aware retrieval, evaluation and launch.
Taxes	Excluded	Applicable taxes, if any, are charged as required by law.
Recurring services	Excluded	LLM/API use, cloud hosting, vector database, domain and third-party service charges.

Payment schedule

Milestone	Phase 1 ERP	Phase 2 AI
Kickoff & discovery approval	40% - PKR 480,000	50% - USD 1,250
UAT-ready solution	40% - PKR 480,000	30% - USD 750
Go-live & handover	20% - PKR 240,000	20% - USD 500

Commercial note

Phase 2 pricing applies to the defined v1 assistant. Autonomous write-actions, complex external integrations, private/on-premise model hosting, extensive data remediation, custom mobile AI apps and advanced analytics are subject to separate scope and quotation.

6. Assumptions, Support & Next Decision

Included support

Each phase includes 30 calendar days of remote post-go-live warranty support for defects within the delivered scope. Enhancements, additional support coverage and recurring infrastructure services may be covered by a separate support agreement.

Not included unless separately agreed

- Additional branches after Islamabad, Lahore and Karachi; indicative setup fee: PKR 125,000 per branch, subject to confirmation.
- FBR/e-invoicing, banking, payment gateway, biometric, GPS, SMS/WhatsApp or third-party integrations.
- Hardware purchases, major historical transaction migration, extensive source-document cleansing or bespoke reports.
- Guaranteed AI accuracy, automated financial/operational approvals, or replacement of human review.

Recommended decision

Approve Phase 1, nominate the Client project owner and branch key users, and schedule the discovery workshop. Phase 2 should be approved after the data sources, access matrix and AI evaluation questions are validated during the ERP rollout.
